Education

Ph.D. Economics <i>expected 2027</i>	McGill University <i>Fall 2021–</i>
M.A. Economics	Yonsei University <i>Mar 2019–Feb 2021</i>
B.A. Quantitative Risk Management and Economics	Yonsei University <i>Mar 2014–Aug 2018</i>

Fields of Specialization

Primary: Macroeconomics
Secondary: Labor Economics

Dissertation

Firm-level Workforce Composition and Firm Dynamics
Supervisors: Prof. Rui Castro, Prof. Markus Poschke

Job Market Paper

“Firm-level Workforce Composition and Firm Dynamics”

Using Canadian employer–employee matched data, this paper shows the importance of workforce quality for firms’ productivity and performance. By looking at how firms adjust their workforce composition over the life-cycle, this paper highlights the importance of initial workforce quality for the firms’ future. Firms start with a small but high-quality workforce, then expand with lower quality workers, diluting workforce quality. While firms share the trend, longer surviving firms always have a better workforce than those that exit earlier. To explain the findings, I develop a firm dynamics model with endogenous productivity growth and choice over the mix of heterogeneous workers. Only some high quality workers, ‘leaders’, have the capability to build organizational capital, an intangible asset that raises productivity. As firms enter with little organizational capital, leaders are most needed when firms are young. Once enough of organizational capital is accumulated, firms scale up with the lower quality ‘regular workers’, who produce based on the foundation the leaders have laid. I use the calibrated model to quantify the importance of leaders for the aggregate economy. I find that a one percent increase in the wage of leaders lowers long-run aggregate productivity by 0.6%, of which 80% comes from the forgone opportunity to accumulate organizational capital.
